10 ABSTRACT: Enter the text of your abstract here. This is a sample American Meteorological
11 Society (AMS) L^AT_EX template. This document provides authors with instructions on the use of
12 the AMS L^AT_EX template. Authors should refer to the file amspaperV6.1.tex to review the actual
13 L^AT_EX code used to create this document. The templateV6.1.tex file should be modified by authors
14 for their own manuscript.

15 SIGNIFICANCE STATEMENT: Enter significance statement here, no more than 120
16 words. See [www.ametsoc.org/index.cfm/ams/publications/author-information/
17 significance-statements/](http://www.ametsoc.org/index.cfm/ams/publications/author-information/significance-statements/) for details.

18 **1. Introduction**

19 This document will provide authors with the basic American Meteorological Society (AMS)
20 formatting guidelines. This document was created using L^AT_EX and demonstrates how to use the
21 L^AT_EX template when submitting a manuscript to the AMS. The following sections will outline the
22 guidelines and formatting for text, math, figures, and tables while using L^AT_EX for a submission to
23 the AMS. An attempt to compile `amspaperv6.1.tex` should be made before using the template. The
24 files have been tested using T_EX Live 2020 (available online at <http://www.tug.org/texlive/>).
25 Feedback and questions should be sent to latex@ametsoc.org. Additional information is available
26 on the AMS L^AT_EX Submission Info web page (www.ametsoc.org/pubslatex).

27 Authors should use the empty `templatev6.1.tex` to begin their paper. A valuable source of L^AT_EX
28 information is the TeX Frequently Asked Questions page (available online at [https://texfaq.
29 org/](https://texfaq.org/)).

30 **2. Formatting text and sections**

31 The text should be divided into sections, each with a separate heading and consecutive numbering.
32 Note, however, that single secondary, tertiary, and quaternary sections remain unnumbered. Each
33 section heading should be placed on a separate line using the appropriate L^AT_EX commands.

34 *Secondary headings*

35 Secondary headings labeled with letters are formatted using the `\subsection*{ }` for a single
36 subsection within a section or `\subsection{ }` for multiple subsections within one section.

37 TERTIARY HEADINGS

38 Tertiary headings are formatted using the `\subsubsection*{ }` for single a subsubsection within a
39 subsection or `\subsubsection{ }` for multiple subsubsections within a subsection.

40 *Quaternary headings* Quaternary headings are formatted using the `\paragraph*{}` for a single
41 paragraph within a subsubsection or `\paragraph{}` for multiple paragraphs within a subsection.

42 **3. Citations**

43 Citations to standard references in text should consist of the name of the author and the year
44 of publication, for example, Becker and Schmitz (2003) or (Becker and Schmitz 2003) using the
45 appropriate `\citet` or `\citep` commands, respectively. A variety of citation formats can be used
46 with the `natbib` package; however, the AMS prefers that authors use only the `\citet` and `\citep`
47 commands. References should be entered in the `references.bib` file. For a thorough discussion of
48 how to enter references into the `references.bib` database file following AMS style, please refer to
49 the **AMS_RefsV6.pdf** document included in this package.

50 **4. Formatting math**

51 The following sections will outline the basic formatting rules for mathematical symbols and
52 units. In addition, a review of the `amspaper.tex` file will show how this is done with the use of
53 \LaTeX commands. The AMS template provides the American Mathematical Society `math`, `font`,
54 `symbol`, and `boldface` packages for use in math mode.

55 *a. Mathematical symbols*

56 Symbols must be of the same font style both in text discussion and in displayed equations or
57 terms (and figures should be prepared to match). Scalar single-character symbols are set italic,
58 Greek, or script. Examples are u , L [note that ν (Greek upsilon) is used instead of v (italic “vee”)
59 to avoid confusion with ν (Greek nu) often used for viscosity; this is handled automatically when
60 in \LaTeX math mode], w , x , y , z , f , g , r , indices such as i or j , and constants such as C_D , k , or
61 K . Multiple-character scalar variables, abbreviations, nondimensional numbers, and acronyms for
62 variables are set regular nonitalic: LWC, Re, Ro, BT, abs, obs, max, min, Re/Im (real/imaginary),
63 etc. For vectors, use boldface nonitalic Times Roman as in \mathbf{V} , \mathbf{v} , or \mathbf{x} , and \mathbf{i} , \mathbf{j} , and \mathbf{k} unit vectors.
64 Do not use the \LaTeX `\vec` command to denote vectors. For matrix notation, use nonitalic boldface
65 Arial (or sans serif) font as in \mathbf{A} , \mathbf{B} , or \mathbf{M} . All mathematical operator abbreviations/acronyms are

66 set lowercase regular Roman font, except O (on the order of): \sin , \cos , \tan , \tanh , cov , Pr (for
67 probability; note same as Prandtl number), const (for constant), c.c. (complex conjugate).

68 *b. Units*

69 Units are always set on a single line with a space separating the denominator, which is set with a
70 superscript -1 , -2 , and so on, rather than using a slash for “per.” Examples are g kg^{-1} , $\text{m}^2 \text{s}^{-1}$, W
71 m^{-2} , g m^{-3} , and m s^{-1} (note that ms^{-1} is the unit for “per millisecond”).

72 *c. Equations*

73 Brief equations or terms set inline in text must be set as a single-line expression because page
74 proofs are not double spaced, for example, $\rho^{-1}p/x$ or $(1/\rho)p/x$ or $(a-b)/(c+d)$; that is, use a
75 superscript -1 for the denominator. In case of a more complicated term or equation, it should be
76 set as an unnumbered display equation, such as

$$x = \frac{2b \pm \sqrt{b^2 - 4ac}}{2c}.$$

77 Otherwise, numbered display equations can be entered using the appropriate equation command,
78 such as

$$x = \frac{2b \pm \sqrt{b^2 - 4ac}}{2c}. \tag{1}$$

79 Lists of equations are punctuated as written English, and commas, semicolons, and periods are
80 placed where appropriate. Conjunctions such as “and,” “while,” “when,” or “for” are also typically
81 placed before the final element in a mathematical phrase, as befits the intended mathematical
82 meaning.

83 **5. Figures and tables**

84 *a. Figures*

85 The insertion of a sample figure (Fig. 1) and caption is given below (in the .tex document).
86 Standard figure sizes are 19 (one column), 27, 33, and 39 (two columns) picas.

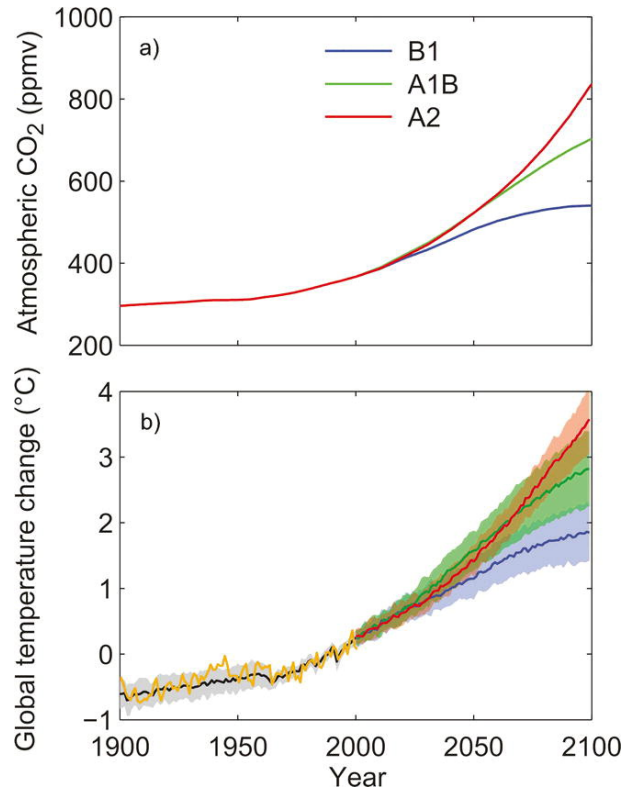

FIG. 1. Enter the caption for your figure here. Repeat as necessary for each of your figures. Figure from Knutti et al. (2008).

b. Tables

Each table must be numbered, provided with a caption, and mentioned specifically in the text. See below for sample table formatting (Tables 1 and A1).

TABLE 1. This is a sample table caption and table layout.

<i>N</i>	<i>X</i>	<i>Y</i>	<i>Z</i>
0000	0000	0010	0000
0005	0004	0012	0000
0010	0009	0020	0000
0014	0010	0029	0005

92 *Acknowledgments.* Keep acknowledgments (note correct spelling: no “e” between the “g” and
93 “m”) as brief as possible. In general, acknowledge only direct help in writing or research. Financial
94 support (e.g., grant numbers) for the work done, for an author, or for the laboratory where the work
95 was performed must be acknowledged here rather than as footnotes to the title or to an author’s name.
96 Contribution numbers (if the work has been published by the author’s institution or organization)
97 should be placed in the acknowledgments rather than as footnotes to the title or to an author’s name.

98 *Data availability statement.* The data availability statement is where authors should describe
99 how the data underlying the findings within the article can be accessed and reused. Au-
100 thors should attempt to provide unrestricted access to all data and materials underlying re-
101 ported findings. If data access is restricted, authors must mention this in the statement. See
102 <http://www.ametsoc.org/PubsDataPolicy> for more details.

103

APPENDIX A

104

Title of Appendix

105 *Appendix section*

106 The AMS template allows authors to format an unlimited number of appendixes. [Note: AMS
107 follows the Chicago Manual of Style, which uses "appendixes" as the plural instead of "appen-
108 dices."] To format a single appendix, use the `\appendix` command with no additional argument.
109 Otherwise, add the appropriate one-letter argument to the `\appendix` command (e.g. `\appendix[A]`,
110 `\appendix[B]`, `\appendix[C]`, etc.) corresponding to the appropriate appendix.

111 The title of the appendix can be formatted using the `\appendixtitle{ }` command. The `\subsection`,
112 `\subsubsection`, and `\paragraph` commands are used to create sections within the appendix. (Note
113 that the appendix title takes the place of `\section` in the appendix, so the first section should begin
114 with `\subsection` instead of `\section`.) Equations are automatically numbered appropriately for
115 each appendix. Here is an example of the first equation in appendix A, automatically labeled (A1):

$$x = \frac{2b \pm \sqrt{b^2 - 4ac}}{2c}. \quad (\text{A1})$$

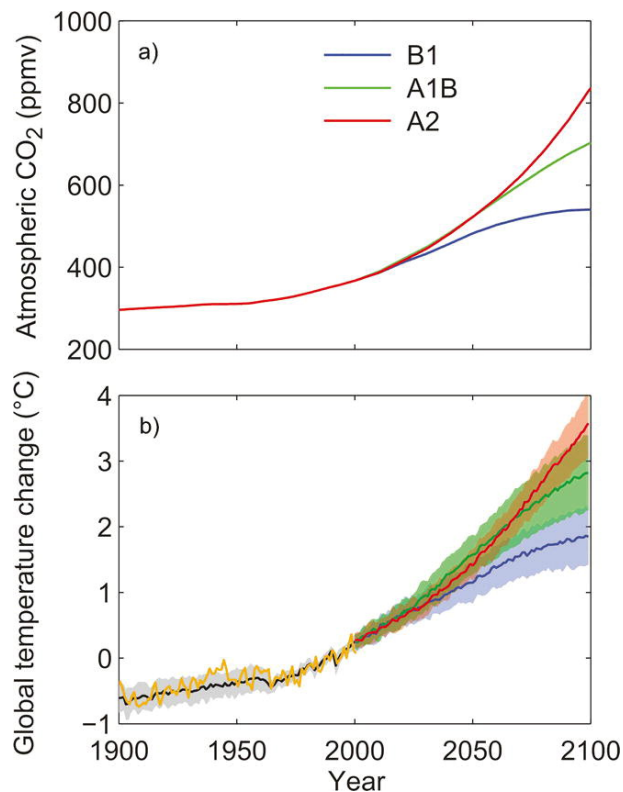

FIG. A1. Here is the figure caption for Fig. A1.

N	X	Y	Z	A	B	C	D
25	1	10	0.60	100	4	80	0.02
50	2	20	1.70	100	4	80	0.02
75	3	40	2.44	100	4	80	0.02
100	4	80	0.02	100	4	80	0.02
100	4	80	0.02	100	4	80	0.02
100	4	80	0.02	100	4	80	0.02
100	4	80	0.02	100	4	80	0.02

TABLE A1. This is sample Table A1.

Appendix figures and tables are now numbered automatically using the standard commands [i.e., the special `\appendcaption` command that was necessary in v5 has been omitted.] (Figs. A1 and A2 and Table A1).

APPENDIX B

File Structure of the AMS L^AT_EX Package

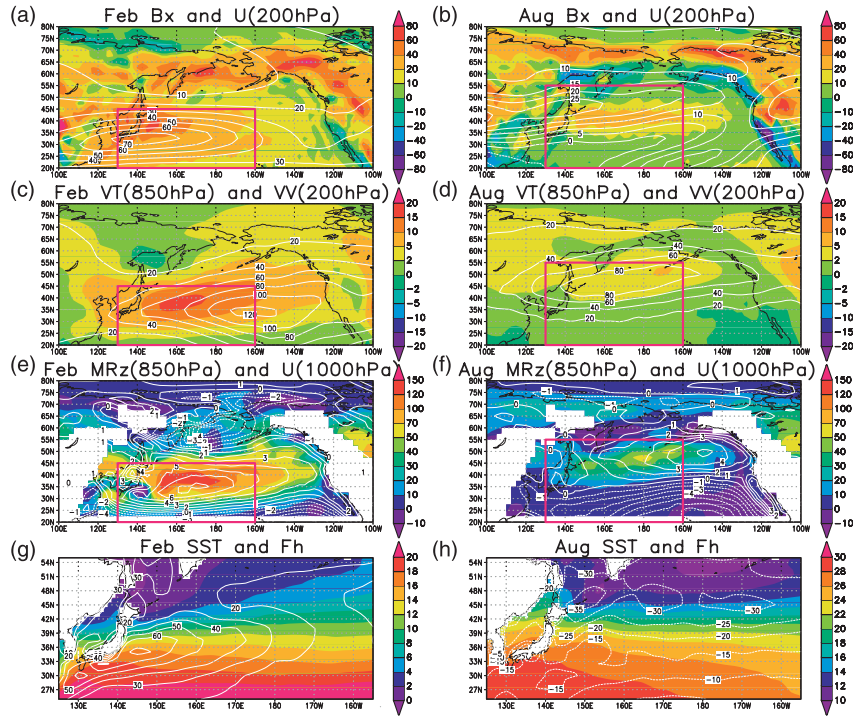

FIG. A2. Here is the figure caption for Fig. A2.

121 *a. AMS L^AT_EX files*

122 You will be provided with a tarred, zipped L^AT_EX package containing 17 files. These files are

123 **Basic style file:** ametsocV6.1.cls.

124 The file ametsocv6.1.cls is the manuscript style file.

- 125 • Using `\documentclass{ametsocv6.1}` for your .tex document will generate a PDF
- 126 that follows all AMS guidelines for submission and peer review.
- 127 • Using `\documentclass[twocol]{ametsocv6.1}` for your .tex document can be used
- 128 to generate a PDF that closely follows the layout of an AMS journal page, including
- 129 single spacing and two columns. This journal style PDF is only for the author's personal
- 130 use, and any papers submitted in this style will not be accepted.

131 Always use `\documentclass{ametsocv6.1}` when generating a PDF for submission to the

132 AMS.

Template: templatev6.1.tex, for the author to use when making their paper. The file provides a basic blank template with some section headings for authors to easily enter their manuscript.

Sample .tex and .pdf files: The file amspaperv6.1.tex contains the L^AT_EX code for the sample file. The resulting PDF can be seen in amspaperv6.1.pdf (this file).

Sample article: Article formatted in draft and two-column mode.

- amssamp1v6.1.tex, amssamp1v6.1.pdf
Formal paper done in draft mode and the resulting .pdf.
- amssamp2v6.1.tex, amssamp2v6.1.pdf
The same paper using the [twocol] option and the resulting .pdf.
- FigOne.pdf, FigTwo.pdf, and figure01.pdf are sample figures.

Bibliography Files: ametsocV6.bst, database2020.bib, and references.bib.

- ametsocV6.bst is the bibliography style file.
- database2020.bib is an example of a bibliographic database file.
- references.bib should be altered with your own bibliography information.

Documentation: found in AMSDocsV6.1.pdf. Additional information found in readme.txt, which contains a list of the files and how they are used.

b. Help for Authors

Questions and feedback concerning the use of the AMS L^AT_EX files should be directed to latex@ametsoc.org. Additional information is available on the AMS L^AT_EX Submission Info web page (www.ametsoc.org/pubs/latex).

APPENDIX C

Building a PDF and Submitting Your L^AT_EX Manuscript Files to the AMS

155 *a. Building your own PDF*

156 There are a variety of different methods and programs that will create a final PDF from your \LaTeX
157 files. The easiest method is to download one of the freely available text editors/compilers such
158 as TexWorks or TeXnicCenter. TexWorks is installed with the TeXLive distribution and provides
159 both a text editor and the ability to compile your files into a PDF.

160 *b. Submitting your files to the AMS for peer review*

161 The AMS uses the Editorial Manager system for all author submissions for peer review. Editorial
162 Manager uses the freely available \TeX Live 2020 distribution. This system will automatically
163 generate a PDF from your submitted \LaTeX files and figures.

164 You should not upload your own PDF into the system. If the system does not build the PDF from
165 your files correctly, refer to the AMS \LaTeX FAQ page first for possible solutions. If your PDF still
166 does not build correctly after trying the solutions on the FAQ page, email latex@ametsoc.org for
167 help.

168 *c. Other software*

169 As mentioned above, there is a variety of software that can be used to edit .tex files and build a
170 PDF. The AMS does not support \LaTeX -related WYSIWYG software, such as Scientific Workplace,
171 or WYSIWYM software, such as LyX. \TeX Live (available online at
172 <http://www.tug.org/texlive/>) is recommended for users needing an up-to-date \LaTeX distri-
173 bution with software that includes an editor and the ability to automatically generate a PDF.

174 This shows how to enter the commands for making a bibliography using BibTeX. It uses refer-
175 ences.bib and the ametsocV6.bst file for the style.
